This presentation contains
Aboriginal and Torres Strait Islander
Men's/male business.

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

Note to the presenter

Because what is known about prostate cancer and its treatment is constantly changing and being improved, the healthcare team can update you with information specific for your unique needs and situation.

This flipchart is written so it can be given as a stand-alone presentation. If you would like further information please contact PCFA (telephone: 02 9438 7000 or freecall 1800 22 00 99, email: enquiries@pcfa.org.au, website: www.pcfa.org.au).

Disclaimer

This flipchart series has been developed in consultation with Aboriginal and Torres Strait Islander communities and consultants to reach a culturally appropriate standard acceptable to Aboriginal and Torres Strait Islander people. PCFA develops materials based on the best available evidence and takes advice from recognised experts in the field when developing resources; however, PCFA cannot guarantee and assumes no legal responsibility for the currency or completeness of the information.

The 'Know about your prostate - prevention and living well' presentation is part of a series of flipcharts that aim to improve prostate cancer information and support for Aboriginal and Torres Strait Islander communities.

Supporting men with prostate cancer through evidence-based resources and support is a Cancer Australia initiative, funded by the Australian Government.

Flipcharts in this set include:

- "Know about your prostate – prevention and living well" (This presentation contains Aboriginal and Torres Strait Islander Men's/male business).
- "Diagnosis, treatment options and challenges – prostate cancer" (This presentation contains Aboriginal and Torres Strait Islander Men's/male business).
- "Support and care - what carers and partners of men with prostate cancer need to know".

Overview

The 'Know about your prostate - prevention and living well' presentation is part of a series of flipcharts that aim to improve prostate cancer information and support for Aboriginal and Torres Strait Islander communities.

This flipchart contains Aboriginal and Torres Strait Islander Men's/male business

It has been reported that Aboriginal and Torres Strait Islander men have lower prostate cancer relative survival rates when compared to non – indigenous men. Prostate cancer is an important issue for Aboriginal and Torres Strait Islander men. 'Know about your prostate – prevention and living well' is designed to provide Aboriginal and Torres Strait Islander men with an overview of prostate specific issues in a culturally safe format.

Why flipcharts

Within the Aboriginal and Torres Strait Island communities news travels fast. Community presentations to spread health messages is good health practice. The project community consultations run by PCFA supported flipcharts as a preferred way of spreading the message.

Flipcharts are:

- applicable to a wide target audience
- an accepted communication method for Aboriginal and Torres Strait Islander health messages
- at an appropriate technology level for a variety of education settings
- more interactive than basic written materials
- delivered by a local health professional who is able to include local context, language, terminology, clinical, health and cultural practices into the delivery.

These notes provide background information and references for health professionals delivering the 'Know about your prostate – prevention and living well' flipchart. The notes provide briefing information for the presenter. They do not follow exactly the flipchart pages as they are not a script and should not be read directly to the participants as part of the presentation. The notes support the flipchart presenter to enable discussion.

PCFA asks people delivering the 'Know about your prostate – prevention and living well' resource to be particularly mindful of the language requirements, the local culture and appropriate introductions acknowledgements and relations with traditional land owners of the place where the presentation is being run.

**Prostate Cancer Foundation of Australia (PCFA)
respects and acknowledges the traditional
custodians and the elders past and present of the
land on which this meeting takes place.**

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 1 – ACKNOWLEDGEMENT OF COUNTRY

Introduction

You should take a few minutes before the 'official' presentation to introduce yourself to your audience. Within Aboriginal and Torres Strait Islander communities relationships to people and 'where is your country' are important points in an introduction. This may be a good place to start.

If possible, get a person or traditional owner from the community to introduce you thereby creating the link.

Try to keep your introduction to 2-3 minutes.

It is important to acknowledge the traditional owners and elders past and present of the land where you are meeting. This needs to be done early in the presentation. The Acknowledgement of Country makes a good connecting point from introducing yourself to the presentation, it actively demonstrates respect for the people you are talking to.

An Acknowledgement of Country is a way of showing awareness of and respect for the traditional Aboriginal or Torres Strait Islander owners of the local area past and present. Incorporating welcoming and acknowledgement protocols into official meetings and events recognises Aboriginal and Torres Strait Islander peoples as the First Australians and custodians of their land. It promotes an awareness of the past and ongoing connection to place of Aboriginal and Torres Strait Islander Australians.

Prostate Cancer Foundation of Australia respects and acknowledges the traditional custodians and the elders past and present of the land on which this meeting takes place.

At a meeting, speech or formal occasion the speaker will begin their proceedings by offering an Acknowledgement of Country.

Acknowledgement of Country is recommended by Federal, State and Territory Government departments.

There are times speaking to a group when an elder or traditional owner may be present, in which case there may be a Welcome to Country given by this person as a more formal opening. This is particularly the case when the meeting involves people from outside the area other than locals.

Ask as part of your preparation if there will be a more formal Welcome to Country at the start of the event. When there has been a formal Welcome to Country, you should thank the elder or traditional land owner for the welcome, then start your Acknowledgement of Country. Always deliver the Acknowledgment of Country at the start of each presentation.

For more information about Welcome and Acknowledgement of country please refer to the Reconciliation Australia website. Information about traditional owners and elders is often available on the Aboriginal Land Council website covering the area where you are presenting.

This artwork is designed and created by Marcus Lee. Marcus Lee's Aboriginal heritage stems from the Karajarri people in the Kimberley region, Western Australia.

Know about your prostate – prevention and living well

CHART 2

Marcus Lee

Marcus was born and raised in Darwin, pursued his design education in Adelaide, and works from Melbourne. Marcus's Indigenous heritage stems from the Karajarri people in the Kimberley region, Western Australia.

Marcus Lee Design is an Indigenous owned graphic design studio which has been successfully operating from Melbourne since 1996. Consisting of a small team of multi-talented graphic designers, illustrators and account service, the studio's combined skills offers a professional boutique design service. Managing and creative director Marcus Lee has been practising the art of graphic design for almost thirty years, through effective partnering in tandem with clients marketing strategies and objectives. This acquired experience has forged an exceptional understanding within the visual communication arena, which has enabled Marcus to efficiently lead and manage his own design business.

Marcus is of Aboriginal heritage and it was inevitable that those roots would pull at his art strings and take him and his design team into the evolving realm of communicating cultural diversity. This also brings with it the scope to participate within the commercial community helping to improve the living standards of Aboriginal and Torres Strait Islanders.

Specialising in the visual design of Indigenous related communication projects, Marcus's extensive design experience adds a professional skill level and value to client's objectives, resulting in the creation of culturally relevant and ultimately unique contemporary solutions.

In 2010 the studio became a certified supplier of AIMSC (Australian Indigenous Minority Supplier Council) now Supply Nation.

What we'll cover today.

- Prostate – what is it?
- When your prostate gets sick
- Prostate cancer
- What you can do?
- Support along the way
- How can PCFA help?

This is a safe space. Do not feel shamed by asking questions.

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 3

By the end of this presentation

Aboriginal and Torres Strait Islander men should know:

- that not all prostate cancer news is doom and gloom
- about the prostate and symptoms if the prostate is not well
- what is involved with testing and deciding on treatments
- where to get information and help.

All good presentations outline what topics will be covered and in what order they will be presented. This provides some direction and focus for the participants.

This is the opportunity to tell the participants that we will be developing a 'safe space' to discuss prostate cancer. People understand and participate well when they feel safe.

Tell participants that this material has been designed with Aboriginal and Torres Strait Islander consultation all the way through and that this flipchart will cover sensitive topics but in a culturally sensitive way.

Remember throughout the session if you are not sure of a response refer the person to their healthcare team or the PCFA 1800 22 00 99 phone line.

Ask people to think about "why they have come", "what they would like to know about prostate cancer" and "what do we all need to do to make this a safe space".

What is a safe space?

It will help people if you can discuss what is a 'safe space'. Make a list of what people say we can do to make people feel safe in this group. Then you can compare it to the activities shown in the next chart.

Creating a safe space.

Mibbinbah 'Proper Way'

REMEMBERING
Respect
Diversity History

CELEBRATING
Collaborating
Questing Transferring

ANTICIPATING
Leading
Mediating Healing

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 4

Mibbinbah Ltd (<http://mibbinbah.org/>) has developed the idea of creating safe places for men to discuss health and wellbeing. This process has become accepted within Aboriginal and Torres Strait Islander communities as good practice for developing safe spaces. Compare the points listed by the group in the previous chart with the components in the Creating a Safe Space chart.

For the purpose of this presentation the terms are all defined below in case you need to clarify any of the listed points.

Today we want to create a 'safe space' to discuss prostate cancer. Let's compare our 'safe space' list with the Mibbinbah 'Safe Space' diagram.

There are three main parts to having a 'safe space' - Celebrating, Remembering and Anticipating. We will describe here what happens in a 'safe space' so people will know what to expect.

CELEBRATING - good news –

Celebrating means we collaborate, we question and we give and teach our skills and knowledge.

Collaboration is actively working together, sharing knowledge, encouraging others to take action, helping when a man is ill. This way we value each others experience, knowledge, skills and help.

Questing is asking and answering questions, seeking and sharing information and resources together.

Transferring knowledge is:

Mentoring - helping others take responsibility for themselves and take action on their health, families and communities.

Yarning - sharing stories, informing and encouraging each other.

REMEMBERING –

Respect yourself first and then respect all others we meet.

Respect History – Experience

1. There are triumphs and strengths – remember most men continue living with prostate cancer.
2. There are challenges and trauma – 3300 men die from prostate cancer in Australia each year.

Respect Diversity – People are different. Respect the Culture of the person and who is their 'mob'? Respect where they are from and what is their journey? Every cancer journey is different.

ANTICIPATING

Leading is to be willing to show the way, support and guide those who may need encouragement. We will honour good conduct, health behaviours, wellbeing and positive spirit.

Mediating – Name problems for what they are, violence and anger are not a solution. Help people avoid negative health outcomes. **We want to do things that will help all of us not feel 'shame' in this space today.**

Spirit Healing – Look ahead to good ways of living healthy positive lives. Helping each other to take action, keep up hope and positive spirit. Practice and find Dadirri – inner deep listening and quiet still awareness.

We hope today having discussed prostate cancer in a 'safe space' you will be able to take action.

What is your prostate?

All men have a prostate gland.

Your prostate makes fluid that is part of your semen.

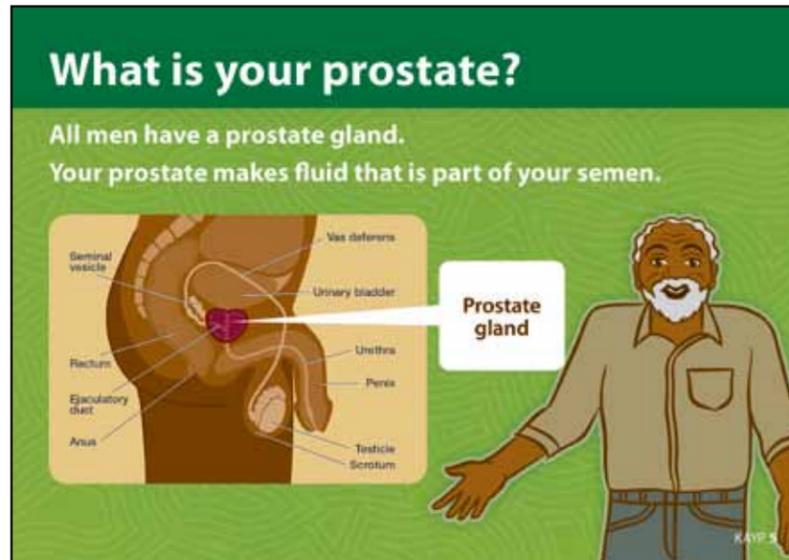

**Prostate
gland**

Know about your prostate – prevention and living well

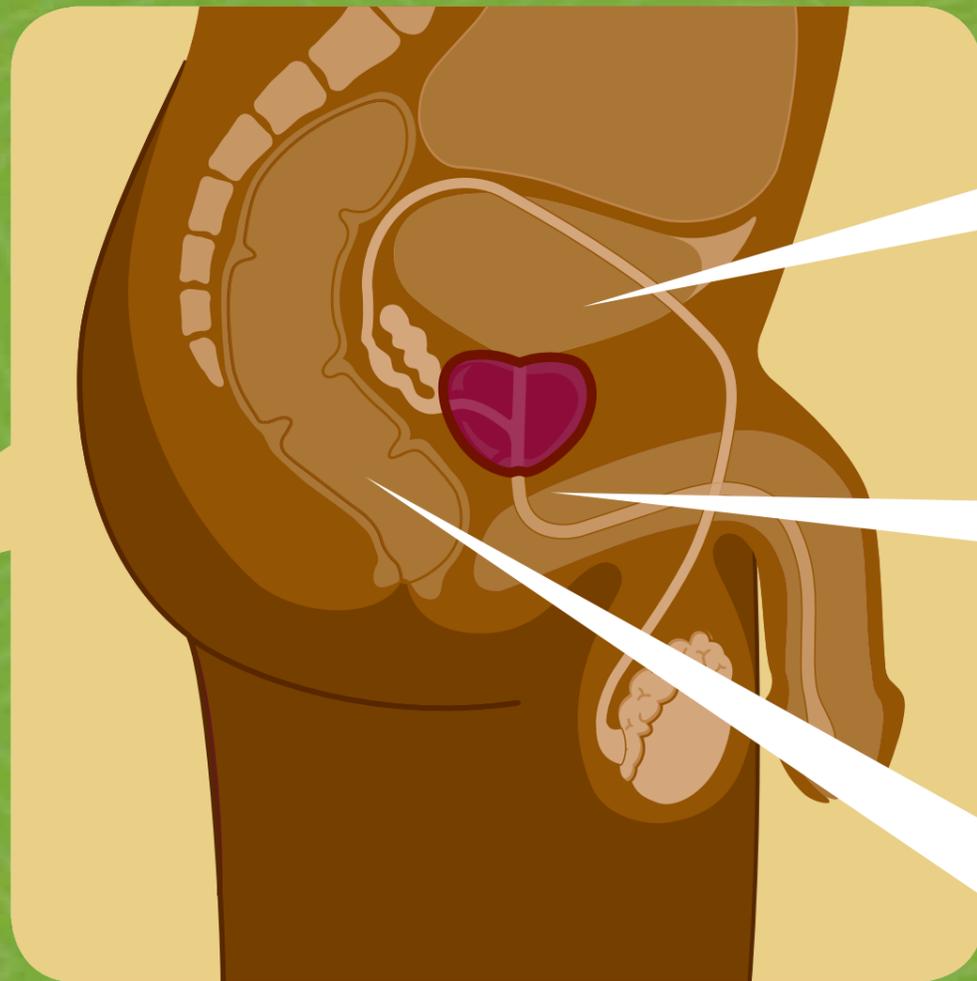

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 5

The prostate is a male sex organ. It provides some of the fluid that makes up semen. All men have a prostate.

Where is your prostate?

Prostate sits under your bladder.

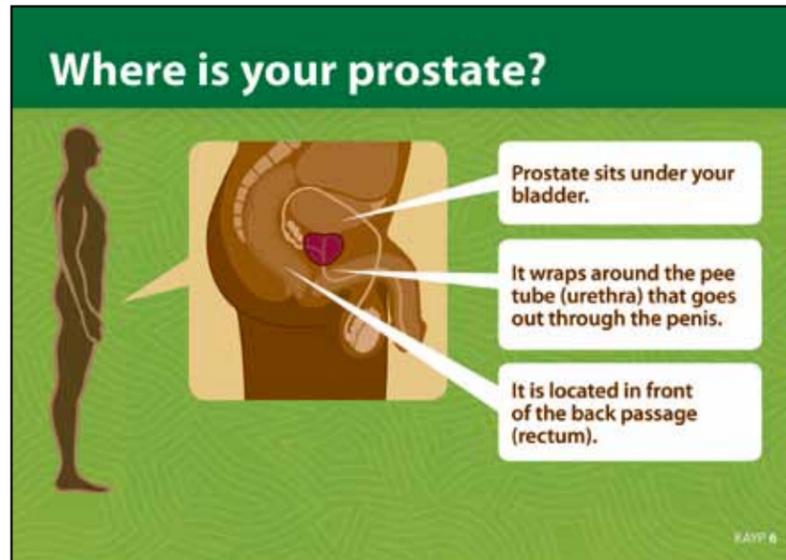

It wraps around the pee tube (urethra) that goes out through the penis.

It is located in front of the back passage (rectum).

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 6

The prostate is located inside the body, immediately below the bladder and just in front of the end part of the bowel called the rectum.

The prostate produces fluid which protects and enriches sperm. The fluid is milky or white in appearance and usually makes up 1/3 of the volume of the semen.

A healthy human prostate is said to be slightly larger than a walnut. The average weight of the “normal” prostate in men is about 11 grams, usually ranging between 7 and 16 grams.

It is shaped like a doughnut and it surrounds the beginning of the urethra (pee tube). Urine passes through the pee tube (urethra) on its way from the bladder (storage bag) to the outside through the penis.

Testosterone (male hormone) makes the prostate grow. If the prostate grows too large, it can slow or stop the flow of pee (urine) down the pee tube.

The nerves that control a hard penis (erections) surround the prostate and can be affected by prostate cancer treatment.

The prostate is located near the exit of the back passage (the rectum), the doctor can check the growth and size of the prostate by feeling the prostate through the rectum wall with a gloved finger. This check is called a Digital Rectal Examination. There are other ways to check the prostate size and growth but they are more involved in time and expense.

When your prostate gets sick.

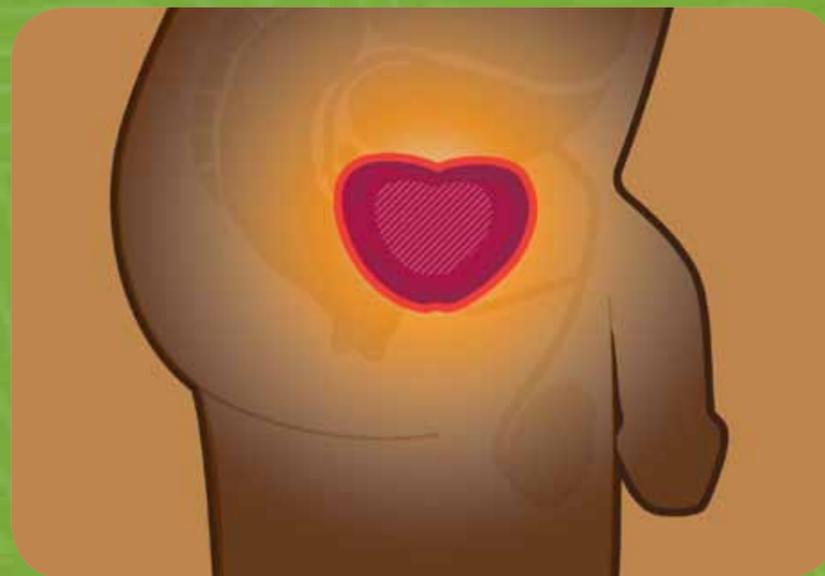

Prostatitis is an infected or inflamed prostate.

This is not cancer.

Benign Prostatic Enlargement (BPE) is a swollen prostate.

This is not cancer.

Prostate cancer happens when prostate cells grow out of control and form a malignant tumour.

This is prostate cancer.

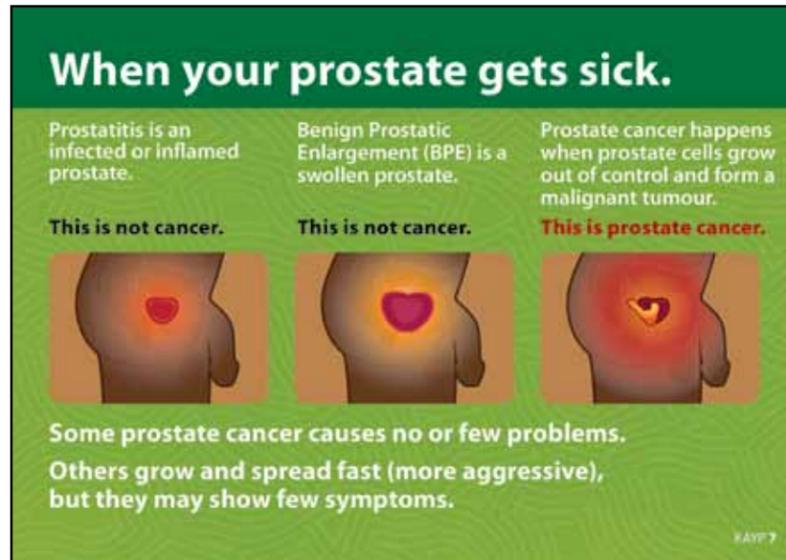

Some prostate cancer causes no or few problems.

Others grow and spread fast (more aggressive), but they may show few symptoms.

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 7

Prostatitis

Prostatitis is an infection in the prostate and sometimes the area around it. There are several types of prostatitis, each with a range of symptoms.

Some men with this disease will experience severe pain and some will not feel much at all. Most will feel some level of discomfort down low in their body. The symptoms can affect the way a man feels, thinks and behaves.

Prostatitis can affect men at any age and it is thought that 1 in every 6 men may experience this illness at some stage during their lives.

Sources:

- Blandy J.(1998). Urology (5th Ed.) Oxford: Blackwell Science.

Benign Prostatic Enlargement (BPE) or Benign Prostatic Hyperplasia (BPH)

Benign Prostatic Enlargement (BPE) is not cancer, it is when the prostate gland grows too big and becomes large enough to cause problems.

As men get older, the prostate gland grows in size, and may press on the urethra (pee tube) which goes through the centre of the prostate. This can slow or stop the flow of urine (pee) from the bladder through the urethra to the outside. It can cause urine to back up in the bladder and lead to the need to go to the toilet more often during the day and night. Other common symptoms include a slow flow of urine (pee), the need to urinate urgently and difficulty starting the urinary stream. More serious problems include urinary tract infections and complete blockage of the urethra (retention), which may be a medical emergency and can damage the kidneys. These symptoms are called Lower Urinary Tract Symptoms or LUTS.

- Napalkov P., Maisonneuve P., & Boyle P. (1995). Worldwide patterns of prevalence and mortality from benign prostatic hyperplasia. *Urology*, 46(3) Supp 1, 41–46.

Lower Urinary Tract Symptoms (LUTS)

Lower urinary tract symptoms are common and can significantly reduce men's quality and enjoyment of life. Having these symptoms does not mean men are more likely to have prostate cancer. Lower urinary tract symptoms do not only occur in cancer. Lower urinary tract symptoms are common in older men. It has been reported that 9 out of 10 men aged 50 to 80 years suffer from lower urinary tract symptoms. If you have any problems passing pee or pain you should go to the doctor or clinic.

Prostate cancer

Prostate cancer is out of control growth of cells in the prostate that form a lump (tumour).

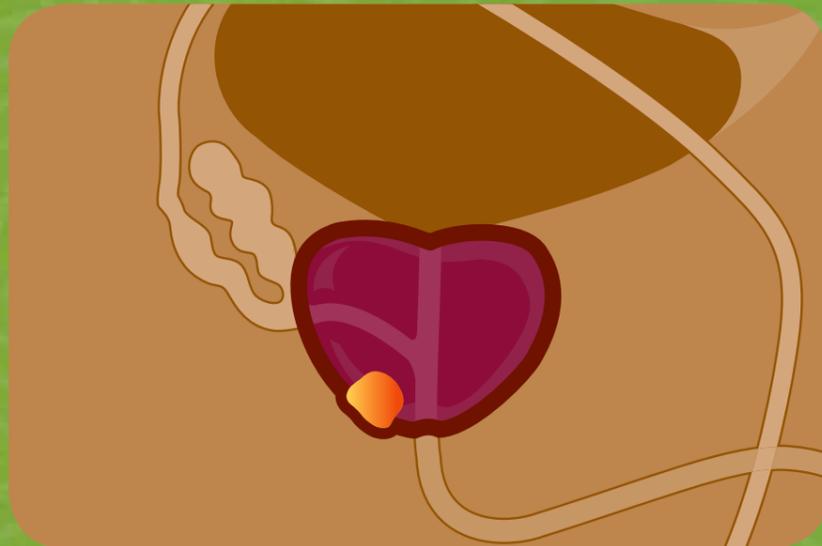

Most prostate cancers grow slower than other types of cancer.

Sources:

- Cancer Council NSW. (2013). Understanding prostate cancer – a guide for men with cancer, their families and friends.

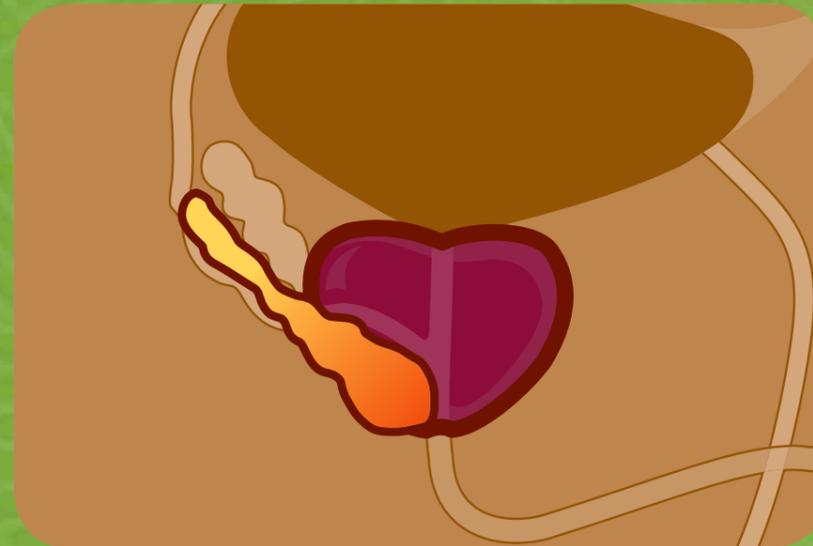

What is prostate cancer?

Localised

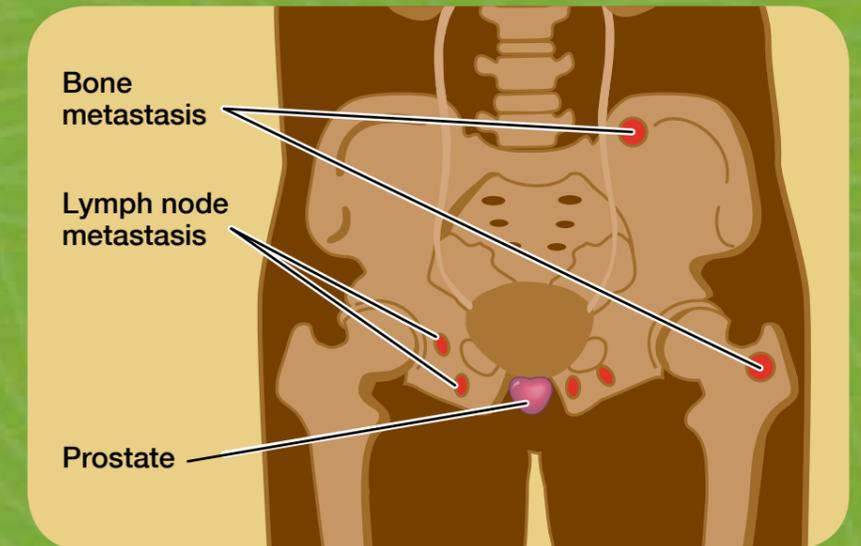

The prostate cancer is found only in the prostate gland.

Locally advanced

The cancer has extended beyond the prostate or to other surrounding organs such as the seminal vesicles, bladder or rectum.

Metastatic

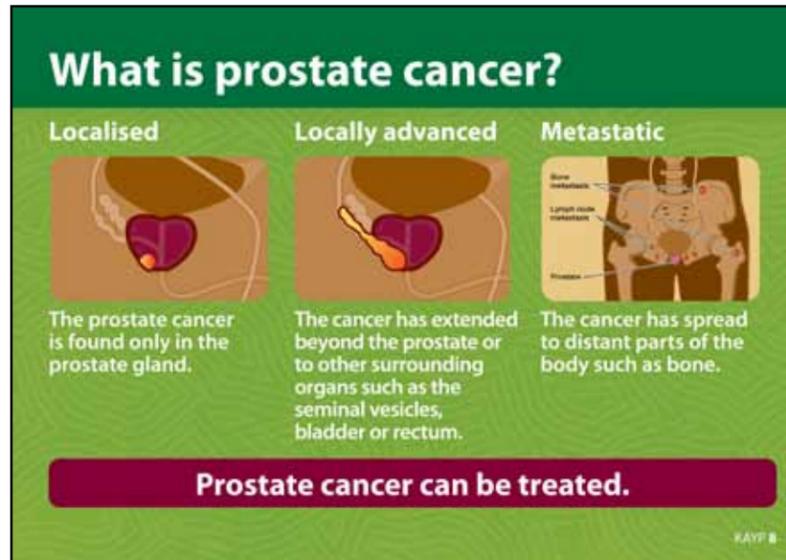

The cancer has spread to distant parts of the body such as bone.

Prostate cancer can be treated.

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 8

Prostate cancer occurs when abnormal cells develop in the prostate, forming a malignant tumour (cancerous growth). These cells have the potential to multiply in an uncontrolled way, and possibly spread outside the prostate into nearby or distant parts of the body.

Prostate cancer is generally a slow-growing disease, and the majority of men with prostate cancer live for many years or decades without painful symptoms, and without it spreading and becoming life-threatening.

Localised prostate cancer or early prostate cancer is when the cancer is found only in the prostate gland.

For some men, their prostate cancer grows slowly and is not aggressive. But in other men the type of cancer grows more quickly and spreads to other parts of the body – this is called advanced prostate cancer.

There are different stages of advanced prostate cancer.

- Locally advanced – the cancer has extended beyond the prostate and may include seminal vesicles or other surrounding organs such as the bladder or rectum.
- Metastatic – the cancer has spread to distant parts of the body such as bone.

.....
Sources:

- Cancer Council NSW (2013). Understanding prostate cancer – a guide for men with cancer, their families and friends.

How would I know?

Possible symptoms:

- Feeling the frequent or sudden need to urinate
- Finding it difficult to urinate (for example, trouble starting, or not being able to urinate when the feeling is there, poor urine flow)
- Discomfort when urinating
- Finding blood in urine or semen.

Some men may have no symptoms.

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 9

In the early stage of prostate cancer, there are usually no symptoms. Later stage prostate cancer may cause symptoms that include:

- feeling the frequent or sudden need to urinate
- finding it difficult to urinate (for example, trouble starting, or not being able to urinate when the feeling is there, poor urine flow)
- discomfort when urinating
- finding blood in urine or semen.

These symptoms are not necessarily caused by prostate cancer. However, it is very important that you speak with a doctor if you have any of these symptoms.

.....
Source:

• Cancer Council Australia (2010). Localised prostate cancer – a guide for men and their families.

What are the tests for diagnosing prostate cancer?

These tests are done at your health clinic or by your doctor.

**Physical examination –
Digital Rectal Exam (DRE)**

**Blood test –
Prostate Specific
Antigen (PSA)**

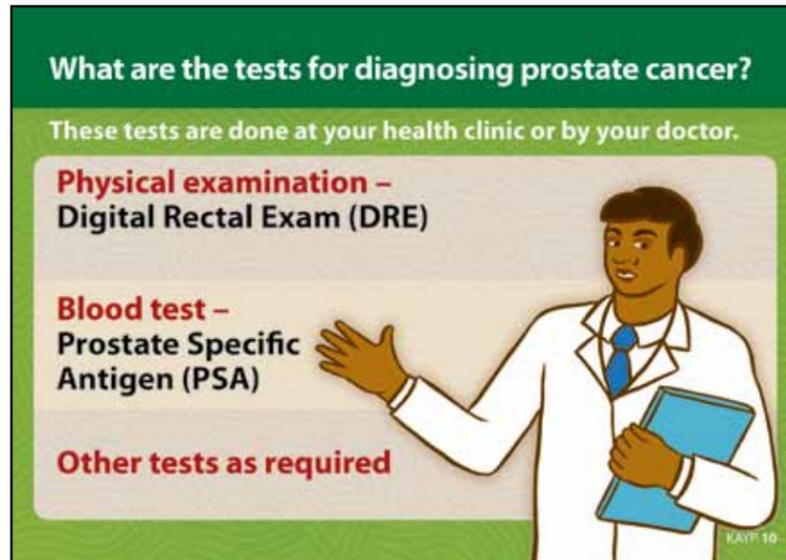

Other tests as required

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 10

A blood test and/or a physical examination are usually what a doctor will initially do to check the health of the prostate and for possible prostate cancer.

- **Blood test** (Prostate Specific Antigen - PSA) – PSA is a protein produced in the prostate and can be measured by a blood test. This test identifies whether there has been an increase in this specific protein in your blood.
- **Digital Rectal Examination** (DRE) – This allows your doctor to feel the size of the prostate and check if there are any abnormalities. Occasionally a cancer can be felt this way, but not always. A normal DRE exam does not rule out prostate cancer.

As a result of these tests, your doctor may request repeat tests and refer you to a urologist, a doctor who specialises in the urinary and reproductive area.

- **Biopsy:** This is the only way a diagnosis of prostate cancer can be made. Your urologist removes small samples of tissue from your prostate using a very thin, hollow needle, guided by an ultrasound. The prostate is either accessed through the rectum (transrectal) or the perineum (transperineal), which is the area between the anus and scrotum. A biopsy is usually done as an out-patient procedure and your doctor will likely advise a course of antibiotics afterwards to reduce the chance of infection. The tissue is sent to a pathologist to identify whether the cells are malignant (i.e. cancerous) or benign (i.e. non-cancerous).

If you're taking medications, let your treating doctor know what they are before the biopsy to reduce the chance of problems.

After the procedure, you may:

- feel some soreness
- have light bleeding from your rectum
- have blood in your urine or stools for a few days
- notice blood or a rust-coloured tint in your semen (this can last for several weeks after the biopsy but depends on how often you ejaculate).

If you're concerned about any of these symptoms, tell your treating doctor.

Other tests that your doctor may suggest include:

- **Free PSA test:** If you have a moderately raised PSA score and your doctor is not sure whether you need a biopsy, you may have another test to measure the free PSA in your blood – that is, the PSA molecules that are not attached to other blood proteins. A decreased level of free PSA can indicate prostate cancer.

- **Prostate Health Index (PHI):** A combination of three blood tests that measure different forms of PSA protein. When reviewed together they provide a personalised risk assessment for prostate cancer.
- **PCA3:** A urine test which measures the level of the PCA3 gene and which, when looked at in conjunction with the PSA test, can help your doctor decide whether you need a biopsy.

The results of these tests are looked at together, giving an overall picture of the prostate cancer. It is only then that the correct treatment options can be discussed with you.

Medicare covers some of the costs of procedures and tests used to diagnose prostate cancer, but there may be some 'out-of-pocket' costs. The doctor can answer questions about procedures, tests and any financial outlays.

Talk to a member of your healthcare team (e.g. social worker) about what financial and practical support services are available. Talk to your local Medicare office about the 'Pharmaceutical Benefits Scheme Safety Net' and the 'Medicare Safety Net' on costs of medications and medical bills (www.humanservices.gov.au/customer/services/medicare/pbs-safety-net and www.humanservices.gov.au/customer/services/medicare/medicare-safety-net).

**Australian men
will be diagnosed
by age 85.**

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 12

In Australia it was estimated that 1 in 7 men had prostate cancer by age 75, 1 in 5 men had prostate cancer by age 85.

Good news – Getting diagnosed in the early stages and having treatment may stop the cancer.

In Australia prostate cancer is the most common cancer in males. About 57 men are diagnosed each day (that's more than 20,000 each year).

In 2012 it was estimated that prostate cancer was the second most common cause of cancer deaths in Australian men.

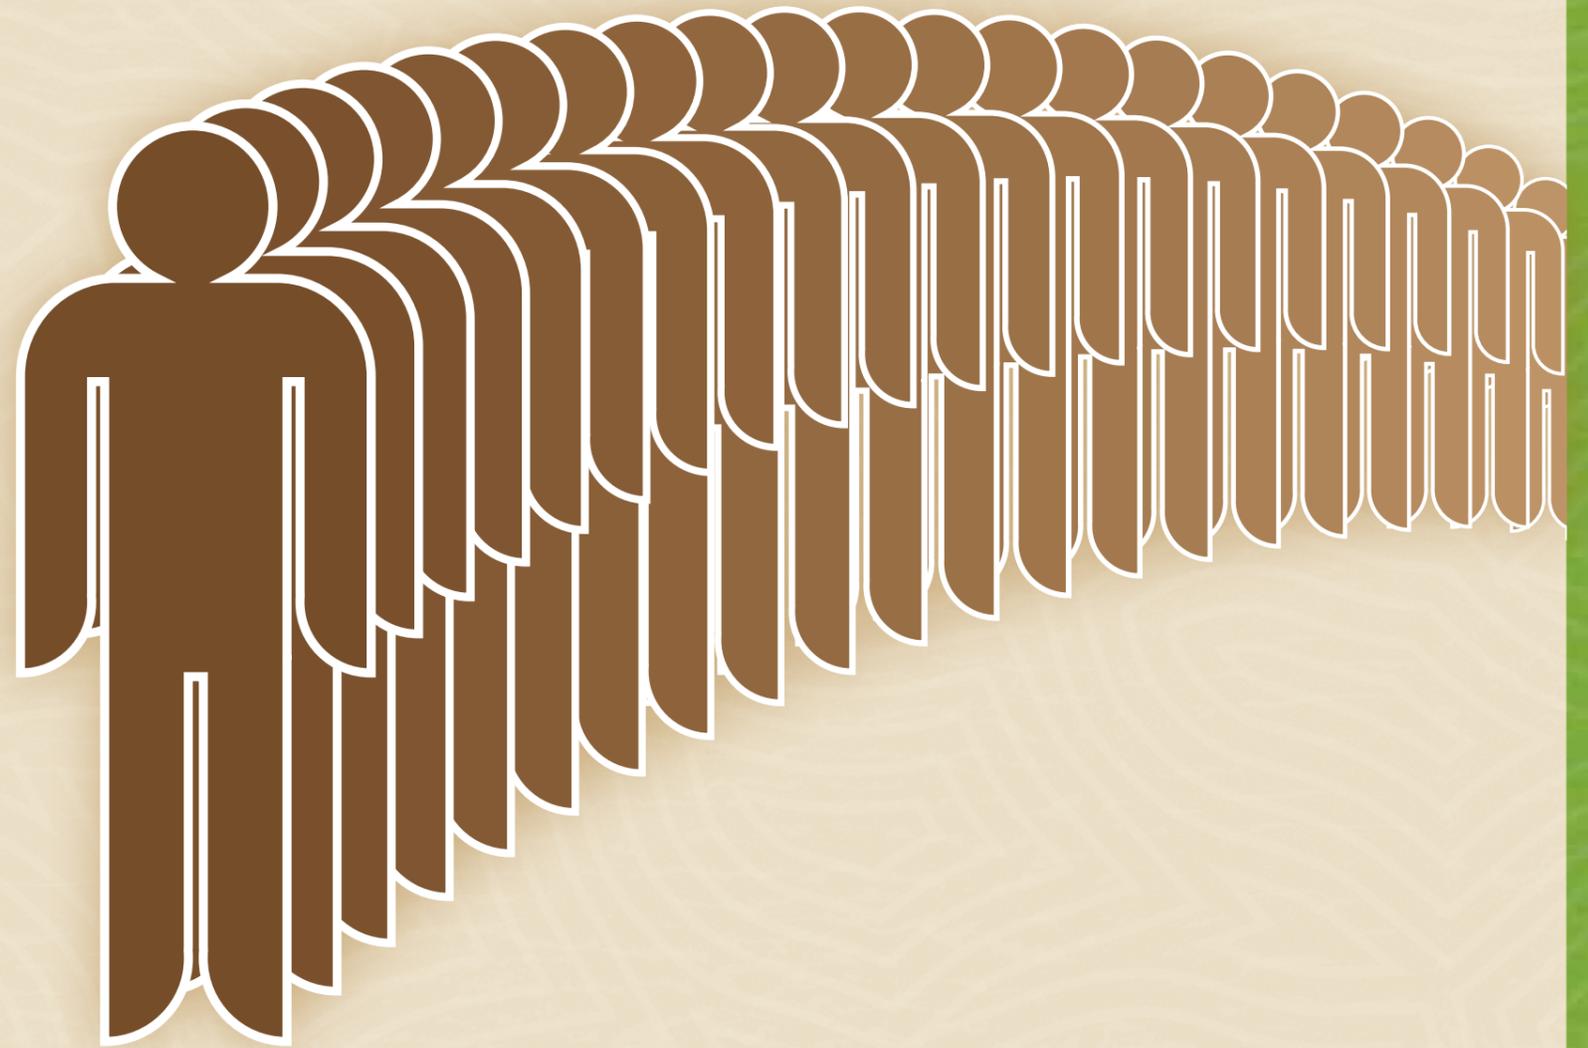

In the decade 2002-2012 around 7.5 million PSA blood tests for prostate problems were performed in Australia (Medicare item # 66655).

Demographics

Aboriginal and Torres Strait Islander men are less likely to be diagnosed with prostate cancer and are less likely to go to hospital for treatment.

Aboriginal and Torres Strait Islander men living in remote areas had lower incidence and hospitalisation rates than non-Indigenous men or even Aboriginal and Torres Strait Islander men living in cities or regional areas.

These results could suggest that Aboriginal and Torres Strait Islander people living in remote and very remote areas have poorer access to healthcare services and are more likely to have cancers that are diagnosed at a later stage when the primary site is no longer apparent.

Is prostate cancer a problem for Aboriginal and Torres Strait Islander men?

Improving a man's health and care for other diseases, identifying the prostate cancer early, getting and staying with treatment, can all improve a man's wellbeing.

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 15

A comparison of Aboriginal and Torres Strait Islander and non-Indigenous men in NSW found that:

- Aboriginal and Torres Strait Islander men with the cancer staying within the prostate were less likely to have their prostate removed (the most common treatment)
- the risk of death from prostate cancer was higher for Aboriginal and Torres Strait Islander men compared with non-Indigenous men after allowing for age at diagnosis, time since diagnosis and spread of disease.

There is still research to be done to improve the lives of men who have prostate cancer.

Good News - treating other illnesses the man may have (comorbidities), helping with access to treatment and cost of the treatment may improve prostate cancer survival rates for Aboriginal and Torres Strait Islander men.

Sources

- Rodger, J., Supramaniam, R., Gibberd, A., Saunders, V., & O'Connell, D. (2012, November). Treatment and survival outcomes for prostate cancer for Aboriginal men in New South Wales (NSW) Australia. Poster session presented at the COSA-IPOS Annual Scientific Meeting, Brisbane.
- Australian Institute of Health and Welfare & Cancer Australia. (2013). Cancer in Aboriginal and Torres Strait Islander peoples of Australia: an overview. Cancer series no.78. Cat. no. CAN 75. Canberra: AIHW.

Some facts.

- Cancer doesn't always cause death.
- Cancer is not punishment for something you did wrong.
- You can't catch prostate cancer from someone who has the cancer.
- Treatment may help cancer go away.

Know about your prostate – prevention and living well

CHART 16

Good news - The majority of men with prostate cancer have learned to manage their prostate cancer, they are living active lives with the disease.

Prostate cancer is not infectious and cannot be given or caught. Prostate cancer is not an infection.

When action is taken early in the prostate cancer development, treatment can help the cancer to go away.

Ask participants what questions they would like to ask. Here are a set of statements that are commonly asked about prostate cancer, they may assist you to discuss points that arise during the presentation. There is no need to go through all of these points stay focused on the group discussion.

If there is a difficult question refer the person to the PCFA 1800 22 00 99 number.

Here are 11 statements about prostate cancer that may be useful in answering general questions.

Risk

Myth 1 - Prostate cancer is common, but few men actually die from it

Facts -

- Around 9 men die each day of prostate cancer in Australia.
- The good news is that if detected early, a man can have more choices about his treatment options.

Myth 2 - Prostate cancer is an old man's disease

Facts -

- While it is true that prostate cancer is more common in older men, it can be found in men of all ages.

Myth 3 - If prostate cancer doesn't run in my family, I won't get it

Facts -

While a family history of prostate cancer doubles a man's odds of being diagnosed, the fact remains that 1 out of 7 Australian men will be diagnosed with prostate cancer by age 75, and 1 in 5 by age 85.

Myth 4 - Vasectomies cause prostate cancer

Facts -

- A vasectomy is a permanent form of contraception. It is an operation that cuts and blocks off the tubes in the groin (the vas) that carry sperm from the testicles to the penis.
- Having a vasectomy was once thought to increase a man's risk of prostate cancer, but recent research suggests that this is NOT the case.
- Vasectomy may however lead to a man getting his prostate checked more often and prostate cancer is subsequently detected more often in men who have had vasectomies.

Myth 5 - Sexual activity increases the risk of developing prostate cancer

Facts -

- High levels of sexual activity or frequent ejaculation were once thought to increase prostate cancer risk.
- In fact, some studies show that men who reported more frequent ejaculations had a lower risk of developing prostate cancer.
- Ejaculation itself has not been linked to prostate cancer.

This resource contains Men's Business

Myth 6 - You can pass your prostate cancer on to others

Facts -

- Prostate cancer is not infectious.
- This means that there is no way for you to "pass it on" to someone else.

Symptoms

Myth 7 - If you don't have any symptoms, then you don't have prostate cancer

Facts -

- Today, because of the availability of the blood test (Prostate Specific Antigen or PSA test), and Digital Rectal Examination many men are diagnosed with prostate issues, some of which are cancer, before they have had any physical symptoms.
- Urinary symptoms like hesitancy, frequency, or dribbling are important and could mean a problem with your prostate. However, not having these symptoms does not rule out prostate cancer.

Myth 8 - The Prostate Specific Antigen (PSA) blood test is a cancer test

Facts -

- The PSA test measures levels of prostate-specific antigen in the bloodstream.
- PSA is increased in the bloodstream in response to a number of problems which could be present in the prostate including an inflammation or infection (prostatitis), enlargement of the prostate gland (also known as benign prostatic hyperplasia) or, possibly, cancer.

Myth 9 - A high PSA level means that you have prostate cancer and a low PSA means you don't

Facts -

- Although prostate cancer is a cause of elevated PSA levels, some men with prostate cancer may have low levels of PSA.

- Factors such as being overweight can impact on PSA levels.
- Again, high levels can be an indication of other medical conditions.

Treatment

Myth 10 - All prostate cancers need to be aggressively treated

Facts -

- Many low grade cancers are not likely to progress to clinical symptoms, and pose limited risk of death if left untreated.
- Some men with prostate cancer may need careful monitoring but no treatment straight away.

Myth 11 - Treatment for prostate cancer always causes impotence or incontinence

Facts -

- While erectile dysfunction (ED) and urinary incontinence are possibilities following surgery or radiation therapy for prostate cancer, it is not true that all men experience complications.
- These side effects can also be highly dependent on age and physical condition. Numerous therapies and aids can improve erectile function and limit incontinence following treatment. Nerve sparing surgical procedures have improved outcomes for patients.

Why some men don't talk to their doctor about getting a prostate check?

- Pressure for men to be tough.
- Men visit doctors less often than women.
- Men are often embarrassed to discuss their health issues.
- Men's business.

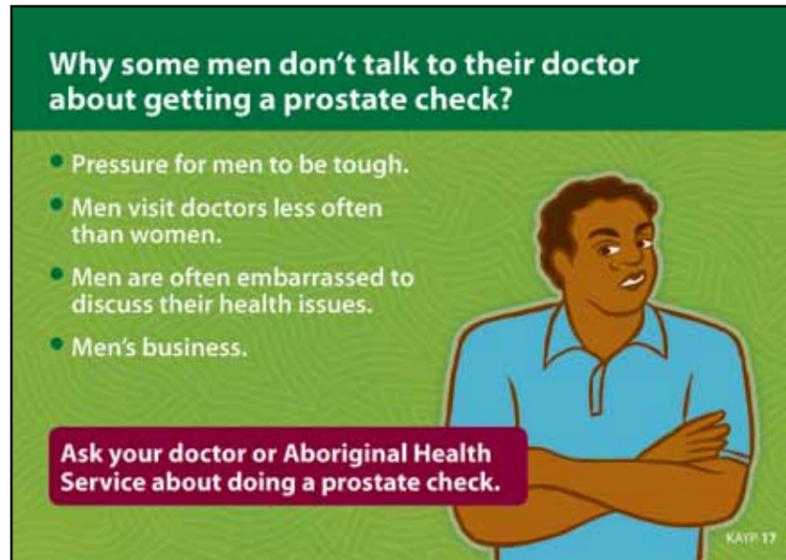

Ask your doctor or Aboriginal Health Service about doing a prostate check.

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 17

There are many reasons why some men do not ask their doctor about a prostate check:

- social pressures
- belief that such things are not talked about
- embarrassment or fear of the tests and results
- in general, men visit doctors less than women. When they do go, men tend to spend less time in consultations
- some men do not know anything about the prostate (or that they have a prostate)
- not all doctors will talk to men about a prostate check unless they are asked by the patient.

A man needs to consider the benefits, risks and uncertainties of testing as well as their chance of having the disease.

If the group feels comfortable and open to discussion – you could use the following question as a discussion starter.

What have other men told you about why they do or don't talk to their doctor about a prostate check?

What are the risk factors?

Age

Getting older

Men

All men have a prostate gland

Family history

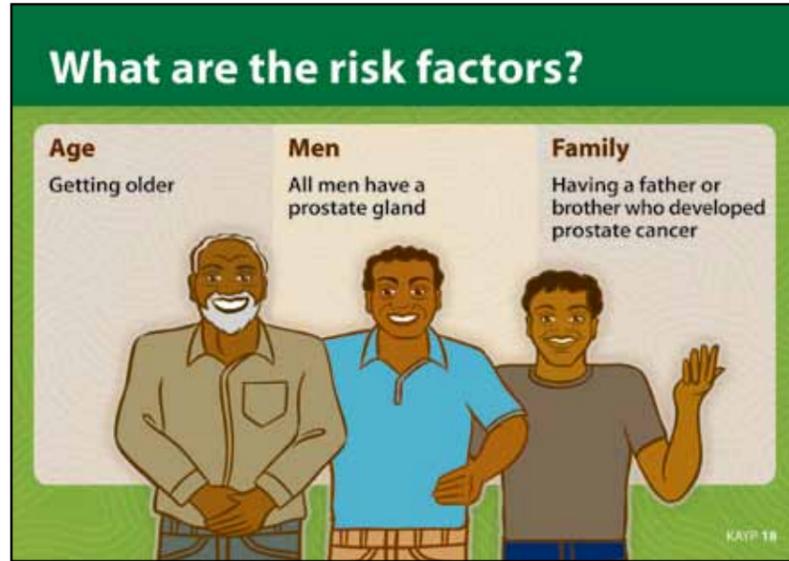

Having a father or brother who developed prostate cancer

Know about your prostate – prevention and living well

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

CHART 18

The risk of prostate cancer increases with age.

Only men get prostate cancer.

Family history increases the chances of developing the disease. Men with a father or brother with prostate cancer are two times as likely to develop the disease.

CHART 19

There are existing materials and information packages you can use to support this section of the presentation. Health promotion materials are already available on HealthInfonet and through the National Aboriginal Community Controlled Health Organisations.

Eat a balanced diet

Having a balanced, adequate and varied diet is an important step towards a happy and healthy lifestyle. Vitamins and minerals in the diet are vital to boost immunity and healthy development. A healthy diet can protect the human body against certain types of diseases, in particular non-communicable diseases such as obesity, diabetes, cardiovascular diseases, some types of cancer and skeletal conditions. Healthy diets can also contribute to maintaining healthy body weight.

Enjoy a wide variety of nutritious foods

The Australian Dietary Guidelines (2013) suggest:

- eat plenty of vegetables, legumes/beans
- eat fruits
- eat plenty of grains (cereals) that are wholegrain and high fibre (including breads, cereals, rice, pasta, noodles, polenta, couscous, oats, quinoa, barley), preferably wholegrain
- include fish, lean meat and poultry, eggs, tofu, nuts, seeds, and legumes/beans
- include milks, yoghurts, cheeses and/or alternatives - reduced fat varieties should be chosen, where possible
- drink plenty of water.

And limit

- saturated fat and moderate total fat intake
- the amount of salt you eat
- your alcohol intake if you choose to drink
- foods containing sugar
- high fat sources. Replace fats by using poly-unsaturated and monosaturated fats such as oils, spreads, nut butters/pastes and avocado.

- National Health and Medical Research Council. Australian dietary guide. Retrieved from www.nhmrc.gov.au/guidelines/publications/n55

Limit alcohol consumption

National Health and Medical Research Council Guidelines for alcohol consumption have been developed to help reduce your risk of harm from alcohol.

The guidelines are based on the most current and best available scientific research and evidence.

- For healthy men and women, drinking no more than two standard drinks on any day reduces your risk of harm from alcohol-related disease or injury over a lifetime.
- Drinking no more than four standard drinks on a single occasion reduces the risk of alcohol-related injury arising from that occasion.
- The guidelines warn against the use of alcohol and medications together – always seek and comply with medical advice.

Sources:

- National Health and Medical Research Council (2009), Australian guidelines to reduce health risks from drinking alcohol. Retrieved from www.nhmrc.gov.au/_files_nhmrc/publications/attachments/ds10-alcohol.pdf

Your health matters.

Get up, get moving

Don't drink much grog
Don't smoke

CHART 20

Do some physical activity

The Australian Physical Activity Guidelines (Adult) refer to the minimum levels of physical activity required for good health. The guidelines are based on the most current and best available scientific research and evidence.

- Think of movement as an opportunity, not an inconvenience.
- Be active every day in as many ways as you can.
- Put together at least 30-60 minutes of moderate intensity physical activity on most, preferably all, days.
- If you can, also enjoy some regular, vigorous exercise for extra health and fitness.

Look after your mental and emotional wellbeing

Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity. It refers to our emotional, psychological, physical and spiritual being.

CHART 22

Information and materials

Prostate Cancer Foundation of Australia (PCFA) funds a research program to investigate prostate cancer issues. (www.pcfa.org.au)

PCFA has a range of information available. If you would like more information, please go to the website or call the Freecall number – 1800 22 00 99

In addition, PCFA has a number of local support groups across Australia. These are held face-to-face or sometimes over the phone. The support groups are a great way to meet other people who are in a similar situation. Some groups have guest speakers on a range of different topics, some groups are social – most groups are a combination of these two things.

PCFA also supports Prostate Cancer Specialist Nurses - There are lots of nurses throughout Australia working in a variety of jobs helping those affected by prostate cancer. A Prostate Cancer Specialist Nurse is an experienced registered nurse who has received additional training to make them an expert nurse in prostate cancer care. Prostate Cancer Specialist Nurses will help men and their families travel along the prostate cancer journey, providing information and coordinating care. You can locate your nearest Prostate Specialist Nurse through the PCFA website or calling 1800 22 00 99.

What you can do?

- **Look after your health.**
- **Be willing to support prostate Men's Business.**

GLOSSARY

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

Abdomen	The part of the body that includes the stomach, intestine, liver, bladder and kidneys. The abdomen is located between the ribs and hips.
Aboriginal	A person of Aboriginal descent who identifies as an Aboriginal and is accepted as such by the community in which he or she lives.
AIDA	Australian Indigenous Doctors Association
AIHW	Australian Institute of Health and Welfare
Androgen deprivation therapy	Treatment with drugs that minimises the effect of testosterone in the body. This is also referred to as ADT and is another term for hormone therapy.
Biopsy	The removal of a small amount of tissue from the body, for examination under a microscope, to help diagnose a disease.
Bladder	A sac with an elastic wall of muscle; found in the lower part of the abdomen. The bladder stores urine until it is passed from the body.
Brachytherapy	A type of radiotherapy treatment that implants radioactive material sealed in needles or seeds into or near the tumour.
Cancer	A term for diseases in which abnormal cells divide without control.
Cancer journey	An individual's experience of cancer, from detection and screening, diagnosis and treatment, to relapse, recovery and/or palliative care.
Cancer survivor	In these resources, this term is used to mean anyone who has finished their active cancer treatment.
Carer	A person who helps someone through an illness or disability such as cancer.
Confined	Using prostate cancer as an example – the cancer is confined to or confined within the prostate gland. This means that the cancer cells have not spread from the prostate gland to other areas of the body.
CT (computerised tomography) scan	The technique for constructing pictures from cross-sections of the body, by x-raying the part of the body to be examined from many different angles.
Cultural engagement	Actively involve people with respect to their cultural needs.
Diagnosis	The identification and naming of a person's disease.
Diarrhoea	Opening the bowels very frequently. Motions may be watery.
Dietitian	A health professional who specialises in human nutrition.
Digital rectal examination (DRE)	An examination of the prostate gland through the wall of the rectum. Your doctor will insert a gloved finger into the rectum and is able to feel the shape of the prostate gland. Irregularities in the shape and size may be caused by cancer.

Dose	The amount of medication taken.
Erectile dysfunction	Inability to achieve or maintain an erection firm enough for penetration.
Erection	When the penis becomes enlarged and rigid.
External beam radiotherapy (EBRT)	Uses x-rays directed from an external machine to destroy cancer cells.
External radiotherapy	Radiotherapy administered by a machine, which targets radiation at the cancer.
Faeces	Bowel motions or stools (poo).
Fertility	Ability to have children.
General practitioner (GP)	General practitioners diagnose, refer and treat the health problems of individuals and families in the community. Also commonly referred to as family doctors.
Grade	A score that describes how quickly the tumour is likely to grow.
Health outcome	A health-related change due to a preventive or clinical intervention or service. The intervention may be single or multiple, and the outcome may relate to a person, group or population, or be partly or wholly due to the intervention.
Hormone	A substance that affects how your body works. Some hormones control growth, others control reproduction. They are distributed around the body through the bloodstream.
Hormone therapy/treatment	A treatment that blocks the body's natural hormones, which help cancer grow.
Impotence	See erectile dysfunction.
Incidence	The number of new cases of a disease diagnosed each year.
Incontinence	Inability to hold or control the loss of urine or faeces.
Kin	A group of persons descended from a common ancestor or constituting a family, clan, tribe, or race.
Libido	Sex drive.
Localised prostate cancer	Prostate cancer that is at an early stage and is still contained within the prostate gland.
Locally advanced prostate cancer	Cancer which has spread beyond the prostate capsule and may include the seminal vesicles but still confined to the prostate region.

Know about your prostate – prevention and living well

GLOSSARY

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

Lymphoedema	Swelling caused by a build-up of lymph fluid. This happens when lymph nodes do not drain properly, usually after lymph glands are removed or damaged by radiotherapy.
Magnetic resonance imaging (MRI)	Similar to a CT scan, but this test uses magnetism instead of x-rays to build up cross-sectional pictures of the body.
Medical oncologist	A doctor who specialises in diagnosing and treating cancer using chemotherapy, hormonal therapy, and biological therapy. A medical oncologist often is the main health care provider for someone who has cancer. A medical oncologist also gives supportive care and may coordinate treatment given by other specialists.
Metastasis/ metastasise	The cancer has spread away from the place where it began.
Mortality	The death rate, or the number of deaths in a certain group of people in a certain period of time. Mortality may be reported for people who have a certain disease, live in one area of the country, or who are of a certain sex, age, or ethnic group.
MRI scan	See magnetic resonance imaging.
Multidisciplinary care	This is when medical, nursing and allied health professionals involved in a person's care work together with the person to consider all treatment options and develop a care plan that best meets the needs of that person.
NACCHO	National Aboriginal Community Controlled Health Organisation
Nausea	Feeling sick or wanting to be sick.
Neoadjuvant therapy or neoadjuvant treatment	Treatment given before the main treatment to increase the chances of a cure.
NGO	Non-Government Organisation
NHMRC	National Health and Medical Research Council
Nutrition	The process of eating and digesting the necessary food the body needs.
Oncologist	A doctor who specialises in the study and treatment of cancer.
Osteoporosis	A decrease in bone mass, causing bones to become fragile. This makes them brittle and liable to break.
Orchidectomy	The surgical removal of the testicles.

Pathologist	A person who studies diseases to understand their nature and cause. Pathologists examine biopsies under a microscope to diagnose cancer and other diseases.
Patient-centred care	Patient-centred care considers patients' cultural traditions, their personal preferences and values, their family situations, and their lifestyles. It makes patients and their families an integral part of the care team who collaborate with health care professionals in making clinical decisions. Patient-centred care provides an opportunity for patients to decide important aspects of self-care and monitoring. Patient-centred care ensures that transitions between providers, departments, and health care settings are respectful, coordinated, and efficient. When care is patient centred, unneeded and unwanted services can be reduced.
PBS	Pharmaceutical Benefits Scheme
Pee	Urine a fluid stored in the bladder.
Pee Tube	Urethra - The tube that carries urine and semen out through the penis and to the outside of the body.
Pelvic	The area located below the waist and surrounded by the hips and pubic bone.
Penis	The male reproductive organ consists of a body or shaft which starts deep inside the body and extends externally to the end of the penis at the glans (head).
PET scan	Positron Emission Tomography. A technique used to build up clear and detailed cross-section pictures of the body. The person is injected with a glucose solution containing a small amount of radioactive material. The PET scanner can 'see' the radioactive substance. Damaged or cancerous cells show up as areas where the glucose solution is being used.
Potency	The ability to have and maintain erections firm enough for penetration.
Primary cancer/ site	The original cancer. Cells from the primary cancer may break away and be carried to other parts of the body, where secondary cancers form. / The initial location of a cancer in the body when it is first diagnosed.
Prostate cancer	Cancer of the prostate, the male organ that sits next to the urinary bladder and contributes to semen (sperm fluid) production.
Prostate gland	The prostate gland is normally the size of a walnut. It is located between the bladder and the penis and sits in front of the rectum. It produces fluid that forms part of semen.

Know about your prostate – prevention and living well

GLOSSARY

Prostate specific antigen (PSA)	A protein produced by cells in the prostate gland, which is usually found in the blood in larger than normal amounts when prostate cancer is present.
Quality of life	An individual's overall appraisal of their situation and wellbeing. Quality of life encompasses symptoms of disease and side effects of treatment, functional capacity, social interactions and relationships, and occupational functioning.
Radiation oncologist	A doctor who specialises in treating cancer with radiotherapy.
Radiotherapy or radiation oncology	The use of radiation, usually x-rays or gamma rays, to kill tumour cells or injure them so they cannot grow or multiply.
Rectum	The last part of the bowel, leading to the anus, through which stool passes.
Recurrence	Cancer that has returned sometime after it was first treated.
Recurrent cancer	A cancer that grows from the cells of a primary cancer that have evaded treatment.
Risk factor	A substance or condition that increases an individual's chances of getting a particular type of cancer.
Secondary cancer	Also called a metastasis. A tumour that has spread from the original site to another part of the body.
Self-management	An awareness and active participation by people with cancer in their recovery, recuperation, and rehabilitation, to minimise the consequences of treatment, promote survival, health and well-being.
Shared decision-making	Integration of a patient's values, goals and concerns with the best available evidence about benefits, risks and uncertainties of treatment, in order to achieve appropriate health care decisions. It involves clinicians and patients making decisions about the patient's management together.
Side effect	Unintended effects of a drug or treatment.
Stage	The extent of a cancer and whether the disease has spread from an original site to other parts of the body.
Support group	People on whom an individual can rely for the provision of emotional caring and concern, and reinforcement of a sense of personal worth and value. Other components of support may include provision of practical or material aid, information, guidance, feedback and validation of the individual's stressful experiences and coping choices.
Supportive care	Improving the comfort and quality of life for people with cancer.
Surgery	Treatment that involves an operation. This may involve removal of tissue, change in the organisation of the anatomy or placement of prostheses.

This presentation contains Aboriginal and Torres Strait Islander Men's/male business

Testes/testicles	Organs which produce sperm and the male hormone testosterone. They are found in the scrotum.
Testosterone	The major male hormone which is produced by the testicles.
Therapy	Another word for treatment, and includes chemotherapy, radiotherapy, hormone therapy and surgery.
Tissue	A collection of cells that make up each piece (or organ) of the body.
TNM	Tumour Node Metastasis - a staging system used by clinicians to describe how advanced a particular cancer is - which then informs the type of treatment provided.
Torres Strait Islander	A person of Torres Strait Island descent who identifies as a Torres Strait Islander and is accepted as such by the community in which he or she lives.
Tumour	An abnormal growth of tissue. It may be localised (benign) or invade adjacent tissues (malignant) or distant tissues (metastatic).
Ultrasound	The use of soundwaves to build up a picture of the internal parts of the body.
Urethra	The tube that carries urine and semen out through the penis and to the outside of the body. (pee tube)
Urine	Fluid stored in the bladder (pee)
Urologist	Urologists are surgeons who treat men, women and children with problems involving the kidney, bladder, prostate and male reproductive organs. These conditions include cancer, stones, infection, incontinence, sexual dysfunction and pelvic floor problems.
Vasectomy	A permanent form of contraception. It is an operation that cuts and blocks off the tubes in the groin (the vas) that carry sperm from the testicles to the penis.
